VCS HIGHLIGHTS

- 2017 model year update on 6 manufacturers including:
FORD® - JAGUAR® - LEXUS® - MERCEDES® - PSA: (PEUGEOT®/CITROËN®) - VAG®: (AUDI®/SEAT®/SKODA®/VW®)
- Over 40 NEW models and engines added
- Key programming special functions added on AFL & Vauxhall models
- Re-initialise headlamp and SCR sensor reset for most BMW models launched after 2007
- Brake electronics module added for 7 VAG variants

What's New CTM

Reasons to update

Return to
home

VCS HIGHLIGHTS

BMW/MINI

- Extensive AC coverage on a wide range of models from 2012 onwards

DACIA

- Updated ABS antilock brakes module with the steering angle calibration special function
- New LPG engine added for Dacia Dokker Lodgy, Dacia Duster and the Dacia Logan II/Sandero II

FORD

- Side obstacle detection left/right special function added for 5 models

JAGUAR

- Power steering control module added for the F-Pace, XE and the XJ with special functions

LAND ROVER

- Extensive injector programming now available on 8 models

MERCEDES

- 2 new models added and 3 new engines added with special functions such as DPF regeneration, EGR actuator tests and injector programming

VAUXHALL/OPEL

- Extended HVAC coverage on 7 models with actuator recalibration, afterblow option and CAN bus configuration learn.

VOLVO

- New D416T engine added applicable for the S80 and V70 with special functions including DPF regeneration and resetting counter particulate filter
- Park assist camera module added for the V40 and the XC60 with codes data and actuator tests

NEW VEHICLE SPECIFIC CASE STUDIES

VW Golf: Fuel Pump Control Module Fault

- 1.6L direct injection engine malfunction indicator light on - 16575 (P0191)
- Engine cutting out, difficult to restart

A 2000 Volkswagen Golf with a 1.6L direct injection spark ignition engine had a fault that would cause the engine to cut out and become difficult to restart. This vehicle has a high pressure injection petrol engine, which VAG call FSI (fuel stratified injection). A diagnostic scan tool was connected to the vehicle via the data link connector and the following fault code was retrieved: 16575 - 100 Code = P0191 - Fuel Pressure Sensor - 00247 Not A Plausible Signal. The operation of the fuel rail pressure sensor was tested. The 5 volt supply and ground were validated, and although the signal voltage was low at 1.6 volts (should be approximately 2.5 volts at 60 bar fuel pressure) the sensor seem to perform correctly electrically. Live data was observed to monitor the oxygen sensor output, this engine requires a wide band oxygen sensor which operates on a current flow method which is directly proportional to the air/fuel (AFR) mixture strength. A current flow of 0 milliamps indicates an AFR of 14.7:1 which is stoichiometric. A negative current flow indicates a rich mixture and a positive current flow indicates a lean mixture. The live data appeared as expected initially, the oxygen sensor current flow ranging between -0.3 mA and +0.3mA. However after running for about twenty seconds the current flow became excessively positive until a current flow of approximately 4 mA was displayed on the scan tool. This indicated an excessively lean mixture. Any intake or exhaust air leaks were ruled out using a diagnostic smoke machine. There were no leaks evident. A diagram below shows an overview of the fuel system fitted to this vehicle.

1

low indicates a lean mixture. The live data appeared as expected initially, the oxygen sensor current flow ranging between -0.3 mA and +0.3mA. However after running for about twenty seconds the current flow became excessively positive until a current flow of approximately 4 mA was displayed on the scan tool. This indicated an excessively lean mixture. Any intake or exhaust air leaks were ruled out using a diagnostic smoke machine. There were no leaks evident. A diagram below shows an overview of the fuel system fitted to this vehicle.

A) Engine Control Module
B) Fuel Pump Control Module

2

An oscilloscope was connected to the electrical low pressure fuel pump to monitor its operation. The low pressure fuel pump on this vehicle is controlled by a fuel pump control module. The pump control module receives data from the engine control module on a communication line which uses a fixed frequency signal of 20 Hertz to monitor and control the system. The fuel pump control module operates the fuel pump on a high frequency variable pulse width command at 20 kilohertz. The control is on the supply side of the pump, known as high side switching. The ground for the fuel pump is constant. Below shows the waveform collected from the vehicle while the fault was present.

Dynamic Steer Class

Guided Component Tests | 10 Minute Dynamic Steering Class

← Back ✕ Exit

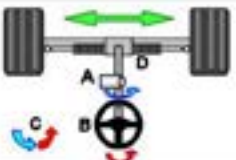

- * In an oversteer situation the ESP stabilises the vehicle in conjunction with the dynamic steering system.
- * A controlled amount of counter steer is applied to prevent rear end "fishtailing", the driver is unaware of this correction.

Understeer:

In this condition the vehicle veers towards the outside of the corner when the wheels are turned.

- * A decrease in lateral acceleration with an increase in steering angle signals this condition.
- * The cornering radius is thus increased.
- * During an understeer condition if the steering angle is increased the lateral traction is decreased and the friction between the road wheel and road surface.
- * The ESP system will be of little or no use during an understeer condition.

This system uses a three phase brushless DC motor to provide steering assistance. The motor magnetic rotor is attached to the steering column shaft with the stator windings located in the steering column housing. To allow commutation of the motor three Hall Effect position sensors are fitted to detect rotor position for control of each phase. The motor can assist the driver input or control the direction of the steered wheels independent of driver input. This feature can be used to provide counter-steer during conditions where the vehicle is not following the intended vehicle direction. This reduces the level of dependence on the ESP system to control the vehicle during transient situations. A mechanical steering lock is used to provide mechanical redundancy in the event of an electrical failure. The device defaults to the locked position when no electrical current is provided to the solenoid.

A) Dynamic steering motor.
B) Driver input to steering wheel.
C) Additive value of driver input and motor assistance.
D) Steering rack.

4 Wheel Steering Class

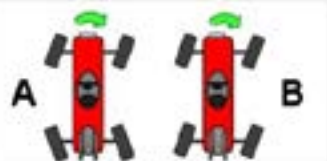

Guided Component Tests | 10 Minute Four Wheel Steering Class

← Back × Exit

10 Minute Four Wheel Steering Class

Some manufacturers are implementing four wheel steering again. The Honda Prelude was the first production car with four wheel steering. The system was purely mechanical. Renault have introduced a modern electronic version. Below are the key points of the system.

- * At low speeds <40 Km/h the rear wheels turn in the opposite direction to the front wheels (up to 3.5°)
- * This results in a smaller turning circle, by essentially shifting the pivot point of the vehicle to the centre of the vehicle.
- * At speeds greater than 40 Km/h the rear wheels turn in the same direction as the front wheels, normally 2°, increasing to 3.5° during emergency situations.
- * This counters the lateral acceleration experienced during cornering.
- * The four wheel steering system works with the electronic stability system for increased safety.
- * During emergency braking both rear wheels can be set to a "toe-in" angle of 3.5° to reduce stopping distances.

A) Low speed maneuvering < 40 km/h
B) High speed maneuvering > 40 km/h

Steering wheel angle	Front wheel angle	Rear wheel angle
160°	10°	0°
120°	10°	3.5°

Fuel Filter Class

Guided Component Tests | 10 Minute Fuel Filter Test Class

← Back  Configure Favorites  Full List ✕ Exit

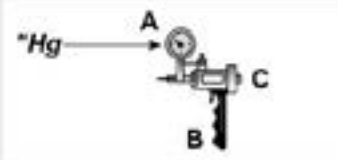

10 Minute Fuel Filter Test Class

The image below shows a typical fuel filter housing/assembly. Sometimes the housing can draw air and air-lock the fuel system. This will result in low fuel pressure and difficulty starting the engine. By inserting a clear tube or pipe into the low pressure circuit the presence of air bubbles can be seen if present.

A) Fuel outlet
B) Fuel inlet
C) Fuel leak-back return

A vacuum pullers can be used to test the condition of the fuel filter housing for correct sealing. Alternately block two of the fuel connections with tightly fitting blanking plugs on the housing and pull a vacuum on the remaining connection. Observe the gauge on the pullers for any depletion of vacuum. This indicates a leak is present. Check the condition of any O-rings fitted and replace if necessary. Check the housing for cracks or physical damage.

A) Gauge with measurement displayed in graduations.
B) Handle.
C) Lever to switch between negative pressure (vacuum) and positive pressure.

*Hg = inches of mercury, a common measurement

C.I. Preheating Class

Guided Component Tests | 16 Minute Compression Ignition Engine Preheating Class

← Back  Configure Favorites  Full List ✕ Exit

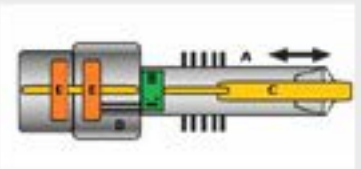

Yellow trace = Applied voltage to heater plug.
Green trace = Current flow through heater plug.

A pressure sensing glow plug has an integrated pressure sensor to monitor combustion chamber pressure in addition to the conventional glow plug. Provides real time feedback per cylinder to the engine ECU, which allows it to compensate for component tolerances and fuel injector degradation, and reduce combustion noise and improve running quality and emissions.

It contains a moving heating rod which transmits pressure to a measuring diaphragm, containing a piezo-resistive sensor.

This signal is processed through an integrated circuit within the glow plug which sends an output signal to the engine ECU.

The glow plug is fitted with a four pin connector with one pin to supply the glow plug element, and three pins for the cylinder pressure sensor: 5V supply, ground, 0.5V-4.5V output signal.

A) Pressure sensing glow plug body.
B) Evaluation electronics and strain gauge.
C) Axially moving heater element.
D) Connections from electronic circuit.
E) Connector rings for electronic circuit and high current element.

Care should be taken removing the pressure sensing glow plug connector, as they are easily damaged.
Care should be taken handling the pressure sensing glow plugs, as mishandling them can impair the sensor's calibration.

Drive Control Class

Guided Component Tests | 15 Minute Drive Control Class

← Back ✕ Exit

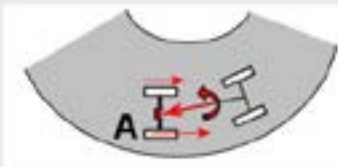

Torque vectoring is the ability to vary the amount of torque being delivered to each wheel, so that one side can receive a greater amount of torque. This can significantly benefit vehicle handling. There are two methods used to control: active braking control and active differential control. These methods can be used simultaneously or independently. For these systems to operate efficiently, various sensor inputs must be monitored such as: yaw, lateral and longitudinal acceleration, steering angle, wheel speed, brake pedal position, engine speed and accelerator pedal position.

Active braking operates by applying braking forces to different wheels independently to generate a yaw movement when cornering. If understeer conditions are detected, the ABS control unit can instantly distribute greater braking force to the inner rear wheel when cornering. This redistributes the available torque to the outer wheels and creates a yaw movement which pulls the vehicle safely and dynamically into the corner. An advantage of this system over the active differential control system is that it can be implemented relatively easily into most modern vehicles with no extra weight or modifications to existing vehicle platforms. However in comparison to active differential systems, torque transfer is limited and the driver may feel a loss in power due to the reliance on braking to transfer torque.

B) Braking force.

Active differential control uses differentials that can redistribute power to the wheels that have traction, which creates the effect of braking torque on one wheel while generating the same amount of driving torque on the other wheel on the same axle. Power can be redirected to the outer rear wheel when cornering to create a difference in force, which results in the effect of pushing the vehicle into the corner, which will reduce the possibility of understeering and minimises the need for steering corrections by the driver. Conversely, an oversteering vehicle can be controlled by transmitting more available engine torque to the front axle. The main advantage of this system is that due to the fact that it does not use braking forces to control traction, no power loss is experienced. In comparison to active braking, active differential systems have a much greater torque transfer.

Drive Control Class

Guided Component Tests | 15 Minute Drive Control Class

← Back × Exit

Engine torque is controlled and programmed through the gearbox, and there will be a multi-plate clutch set which will drive the programmed programmed driving on demand and coupling, which transmits torque to the rear axle differential on demand.

When there is a difference in speed detected between the front and rear axles, an electronic pump is activated which transmits hydraulic pressure to pistons which engages a multi-plate clutch set and establishes a connection between the input shaft and the output shaft of the coupling. There is a temperature sensor fitted to the coupling which is immersed in hydraulic fluid which sends information to the control unit. This information is used to adapt to the varying viscosity of the hydraulic fluid.

15 Minute Relay Test Procedure

A relay is an electro-mechanical device which operates as a high current carrying switch. The relay uses the magnetic properties of a winding when a current flow is applied to it. The current flow creates a relatively strong magnetic field due to the turns-rate of the winding. This magnetic field causes the contacts within the relay to close. A comparatively small current flow is used to generate the magnetic field. When the control circuit of the relay is completed approximately 150 milliamps flows through the coil winding. The relay contacts are capable of carrying from 20 to 80 Amps depending on rating. This can be calculated using Ohm's law. The applied voltage is 12 volts and the resistance of a 12V relay winding is approximately 80 Ohms. +/- 20%.

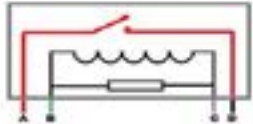

Current flow (I) = Voltage (V) / Resistance (R).

$I = 12 / 80$

$I = 0.15A$ or 150 mA

There are some variations in relay construction however the operation is similar. The most common relay is four pin. Five pin relays, three pin flasher relays and electronically controlled surface mounted relays are fitted to electronic control modules.

As a current flow is flowing in a winding an induced voltage is generated when the control circuit is broken during normal operation. For this reason a resistor or diode is fitted in parallel with the relay winding coil to dissipate the energy from self-induction. The polarity of the diode is important, if the anode is connected to the positive side of the winding the winding will be short circuited.

D) Tensioner

1) ISG starting the engine. (ISG turnign engine)
2) Recouperation or charging. (Engine turning ISG)

Some vehicle manufacturers use a DC-DC voltage stabiliser to ensure the instrument panel, radio and Global Positioning System do not suffer from an under-voltage condition while the engine is restarting. This condition would cause the system to dropout and reboot.

When the ignition is switched on the voltage stabiliser (C) is charged up from terminal 15. When terminal 50 is energised to start the engine a transistor within the voltage stabiliser is switched on. This connects the stabiliser to the instrument panel (D), radio (E) and the GPS system (F).

This allows those systems to work seamlessly during engine cranking phases.

30) Constant live.

Stop Start Class

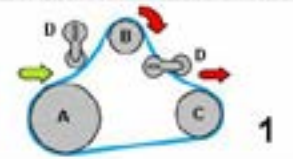

Guided Component Tests | 15 Minute Stop-Start Technology Class

← Back  Configure Favorites  Full List  Exit

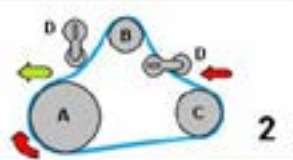

The most basic micro hybrid system is achieved through the use of an enhanced starter motor. Its operation is identical to that of a conventional starter motor except that it is built with reinforced components to withstand the more frequent additional restart actions that the stop-start system demands. An upgrade on this component is the tandem solenoid starter. The tandem solenoid starter uses two solenoids so that it can separately control the forward slide of the pinion gear and energisation of the motor. This allows the pinion gear to engage the ring gear while it is still rotating, allowing faster restarting of the engine. Originally it was necessary for the engine to come to a complete stop before restarting, which was seen as disadvantage in situations where the driver needed to quickly restart the engine.

Belt Driven Starter Generator:

The belt driven starter generator combines the starter and the alternator into one component which is capable of fulfilling smooth starting and charge system requirements. This system uses a high-load belt to deal with the increased torque needed to restart the engine, as well as being able to maintain a suitable belt preload in both start-up and charging operations. An advantage of this system is that it can be used for torque assist at low engine speeds and for regenerative braking in more advanced hybrid systems.

Stop Start Class

Guided Component Tests | 15 Minute Stop-Start Technology Class

← Back ✕ Exit

To reduce the cranking time needed to restart the engine the ECM can use the crankshaft and camshaft sensors to stop the pistons at an optimum position and inject fuel into one cylinder. When the engine needs to restart, the air fuel mixture in that cylinder is ignited to turn the crankshaft with the aid of the starter motor. Even at low rpm, cylinders are already identified for sequential ignition, which enables a fast restart of the engine. There are two types of motor that micro hybrid vehicles use to restart the conventional ICE: an enhanced starter motor with reinforced components, and a belt driven starter generator.

Enhanced Starter Motor:

The most basic micro hybrid system is achieved through the use of an enhanced starter motor. Its operation is identical to that of a conventional starter motor except that it is built with reinforced components to withstand the more frequent additional restart actions that the stop-start system demands. An upgrade on this component is the tandem solenoid starter. The tandem solenoid starter uses two solenoids so that it can separately control the forward slide of the pinion gear and energisation of the motor. This allows the pinion gear to engage the ring gear while it is still rotating, allowing faster restarting of the engine. Originally it was necessary for the engine to come to a complete stop before restarting, which was seen as disadvantage in situations where the driver needed to quickly restart the engine.

- 1) Solenoid for controlling pinion engagement.
- 2) Solenoid for control motor operation.
- 3) Constant supply terminal from battery positive.
- 4) Contactor to motor brushes and commutator.

Belt Driven Starter Generator:

The belt driven starter generator combines the starter and the alternator into one component which is capable of fulfilling smooth starting and charge system requirements. This system uses a high load belt to deal with the increased torque needed to restart the engine, as well as being able to maintain a suitable belt preload in both start-up and charging operations. An advantage of this system is that it can be used for torque assist at low engine speeds and for regenerative braking in more advanced hybrid systems.

Electronically Controlled Transmission Class

Guided Component Tests | Dual Clutch Transmission System

← Back Exit

30 Minute Electronically Controlled Transmission Class - Dual Clutch Transmission System

The dual clutch transmission consists of a manual gearbox which is automatically controlled electronically. A vehicle with a dual clutch transmission feels very similar to an automatic transmission to the driver, as there is no clutch pedal and the gear selector is the same as an automatic.

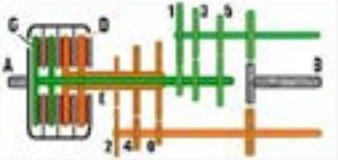

The selector lever is an electronic unit which uses sensors to detect lever position. This information is sent to the transmission control module via CAN bus. By automatically shifting the gear shifts, the dual clutch transmission reduces gear shift time significantly, improving fuel economy, reducing emissions, improving performance and making the vehicle easier to use for the driver.

This is done by a control unit which interprets data regarding the current driving conditions, such as the torque demand from the accelerator pedal position, engine speed, vehicle speed and various other inputs which it uses to monitor driver behaviour.

This control unit then controls which gear to select and when. The dual clutch transmission achieves rapid gear shifts by using two separate clutches, one which can engage the odd gears (1,3,5), and one which controls the even gears (2,4,6).

The clutches are engaged and disengaged by using an electronic actuator. For example, on take-off, the transmission has 1 st gear selected and the clutch controlling 1 st gear is engaged. At the same time 2 nd gear is preselected in anticipation of an upshift and when the control unit decides the ideal conditions are present, disengages the clutch controlling 1 st gear while engaging the clutch controlling 2 nd gear.

Below is a simplified diagram showing both clutch packs and all six forward gears. Reverse gear operation is shown on the next page.

A) Input from engine.
B) Output to final drive.
C) Multi-plate clutch pack 1.
D) Multi-plate clutch pack 2.

Electronically Controlled Transmission Class

Guided Component Tests | Dual Clutch Transmission System

← Back × Exit

Both wet clutches and dry clutches can be used in a dual clutch transmission. Due to its better heat dissipating properties, a wet clutch is generally favoured in high-torque applications. However dry clutch applications are also being developed to handle higher torque, although they are generally found in vehicles with a torque output lower than 250Nm.

The diagram below is an overview of the shaft locations within the transmission. Transmission layouts may vary depending on manufacturer.

- 1) Final Drive/Differential
- 2) Output shaft 1.
- 3) Output shaft 2.
- 4) Input/primary shaft.
- 5) Reverse shaft.

For reverse gear operation an additional shaft is required to reverse the direction of rotation of the output shaft. The image below illustrates the effect an additional gear will have on the direction of rotation in a gearset.

Important: before removing any component from the dual clutch transmission system, check manufacturer's specifications for any special procedures/initializations which need to be performed. Failure to do so may harm the operation of the clutch. Ensure to perform the relevant programming or synchronisation procedures also. These may be done manually or through the use of the diagnostic tool, depending on the vehicle.

REASONS TO INVEST

UPGRADE 

YOU CAN'T AFFORD NOT TO UPGRADE!

Over half of new coverage in every release is for older models you see coming into your bay every day. Just look at the potential revenue if you invest in the latest and most up-to-date vehicle coverage!

3 diagnostic checks per day
£23,490

1 diagnostic check per day
£7,830

PLUS your repair revenue

Calculations based on charging £30 per diagnostic check over a one year period and with 261 working days. You can't enable the repair if you don't perform the diagnosis.

- **Program new keys special function*** available for 12 models from 2004-2017 including:
 - Alfa Romeo Giulia, Alfa Romeo Giulietta, Alfa Romeo Mito, Alfa Romeo 159, Alfa Romeo Brera, Fiat 500, Fiat 500L, Fiat 500X, Fiat Doblo, Fiat Ducato, Fiat Fiorino/Quobo, Fiat Panda, Fiat Punto/Punto Grande/Punto Evo and Fiat Tipo
- **2 new systems added:**
 - NEW Euro 6 system added for Fiat Ducato. Codes, data and actuator tests available with special functions including:
 - Particle filter regeneration, particle filter with integrated pre-cat replacement and injector coding
 - NEW 83 KW electric system added for the Fiat 500. Codes, data and actuator tests available
- **Adaptive cruise control codes, data and actuator tests for the Alfa Romeo Giulia, Lancia Thema and Fiat 500X**
 - Added special function, calibrate the adaptive cruise control, available for Fiat 500X

- **Re-initialise headlamp and selective catalyst reduction (SCR) sensor reset special function available for most models launched since 2007 including:**
 - 1 Series F20/F21, 2 Series F22/F23/F45/F46, 3 Series F30/F31/F34/F80, 4 Series F32/F33/F36/F82, 5 Series F10/F11, 6 Series F12/F13, 7 Series F01/F02/F03/F04, I3 I01, I8 I12, X1 F48, X2 F39, X3 F25, X4 F26, X5 F15 and X6 F16
- **Extensive AC coverage on wide range of models from 2012 onwards with special functions including:**
 - Air conditioning (IHKA) drain/fill the refrigerant circuit, air conditioning (IHKA) flap motor calibration run, air conditioning (IHKA) flap motors installation position, air conditioning (IHKA) re-address flap motors, air conditioning (IHKA) run-in protection for A/C compressor, air conditioning (IHKA) telestart transmitter initialisation, air conditioning (IHKA) re-address flap motors and air conditioning (IHKA) steering-column adjustment (normalisation)
- **Teaching all round vision cameras special function available for 20 models including:**
 - 1 Series, 2 Series, 3 Series, 4 Series, 5 Series, 6 Series, 7 Series, I3, I8, X1, X2, X3, X4, X5, X6, MINI Clubman, MINI 5 Door, MINI 3 Door, MINI Convertible and MINI Countryman

[More](#)[Coverage Data - BMW[®]](#)[Coverage Data - MINI[®]](#)[Makes](#)[Return to

- **Updated ABS antilock brakes module to now include most models from 2015**
 - With codes, data, actuator tests with the steering angle calibration special function
- **New LPG engine added for Dacia Dokker Lodgy, Dacia Duster and the Dacia Logan II/Sandero II**
 - Variants include the Bosch V42 and the Continental 31-25 with codes, data and actuator tests. Special functions also available through the engine management selection
- **Radio decode special function for Dacia Duster II models from 2013 onwards**
 - Codes, data and special functions including language configurations, manual configurations and security code

• 2017 Model Year Update

• 4 models added:

- Ford Fiesta 1.0L petrol, 1.1L petrol and 1.5L diesel
- Ford Kuga 1.5L petrol, 1.5L diesel, 2.0L diesel
- Ford Transit 2.0L diesel
- Ford Transit Custom 2.0L diesel

• Extensive DPF PIDs coverage allowing you to monitor parameter IDs such as DPF soot content and engine temperature. Content available for 15 models including:

- Ford Fiesta, Ford Kuga, Ford Transit, Ford Transit Custom, Ford Focus, Ford C-Max, Ford Mondeo, Ford Galaxy, Ford Smax, Ford Ranger, Ford Connect, Ford B-Max, Ford EcoSport, Ford Courier and Ford Galaxy/ S-Max

- **Side obstacle detection left/right special function added for 5 models including:**
 - Ford Focus 2011-2014, Ford C-Max 2010-2015, Ford Mondeo 2007-2015, Ford Galaxy 2007-2015 and Ford S-Max 2007-2015
- **Proxy Alignment system available for various Ford KA engines 2008-2017**
- **Body control crash status reset added for the Ford Focus 2.3L RS 2016-2017**

- **Model year update to 2017**
- **New XE 2017 model added with various systems, codes, data and actuator tests**
- **Power steering control module added for the F-Pace, XE and the XJ. Codes, data and special functions included**
- **Steering angle sensor module added for the F-Pace, XE and the XJ with codes and data**

- **Extensive injector programming now available:**

- Defender (L316): 2.4L diesel 2007-2011 and 2.2L diesel 2012-2016
- Discovery 4 (L319): 3.0L TDV6 2010-2014, 3.0L TDV6 2015 and 3.0L TDV6 2016+
- Freelander 2 (L359): 2.2L I4 diesel 2011-2014
- Range Rover Sport (L320): 3.0L TDV6 2010-2013
- Range Rover (L322): 4.4L TDV8 2010-2013
- Range Rover Sport (L494): 3.0L TDV6 2013, 3.0L TDV6 2014-2015, 3.0L TDV6 2016+, 3.0L TDV6 Hybrid 2014-2015, 3.0L TDV6 Hybrid 2016+, 4.4L TDV8 2014-2015 and 4.4L TDV8 2016+
- Range Rover (L405): 3.0L TDV6 2013, 3.0L TDV6 2014-2015, 3.0L TDV6 2016+, 3.0L TDV6 Hybrid 2014-2015, 3.0L TDV6 Hybrid 2016+, 4.4L TDV8 2013, 4.4L TDV8 2014-2015 and 4.4L TDV8 2016+
- Range Rover Evoque (L358): 2.2L I4 diesel 2012-2013 and 2.2L I4 diesel 2014-2016
