HVAC System - A/C Blend Door Actuator - DC Voltage Test

Connect test leads:
Yellow=Pin 5
Black=Pin 6

Voltage with blend door in MAX hot position should be about $4.7 \pm 0.15V$.
Voltage with blend door in MAX cool position should be about $0.3 \pm 0.15V$.

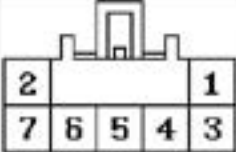

Ignition OFF. Disconnect the actuator harness.

On the actuator, apply 12 volts (+) to pin 3 and ground (-) to pin 7, verify cool position. Reverse the jumper wires, 12 volts (+) to pin 7 and ground (-) to pin 3, verify warm position. Blend door should move smoothly.

Alternator Diode Ripple Test

← Back

Charging System - Alternator Diode Ripple Test

To view the alternator diode with the Vorus Pro,

Connect test leads:

Yellow=Battery(+)

Black=Battery(-)

Note: Test at battery, testing at the jump start point under hood may lead to inaccurate readings.

View Meter

Humps that appear in waveform are normal and represent condition of diodes.

KOER, at fast idle, turn headlights on to increase load on alternator as it is charging the battery at a higher rate. It is typical to see the waveform gradually rise and fall, it may not stay at the zero line.

Small spikes that appear are a result of the voltage regulator and are normal.

View Meter

The most common failures are shorted or open diodes. Notice how large one of the diode patterns is in relation to the others this alternator needs work.
